Graduate School “Mathematics as a Key Technology”
RPTU Kaiserslautern-Landau
Kaiserslautern, Germany

**Subject: Application for admission to the Master programmes Mathematics for Technology and Data Science, Actuarial and Financial Mathematics, and Mathematics International — Summer Semester 2027**

Dear Members of the Admissions Committee,

I am writing to apply for admission to the Master programmes offered by the Graduate School “Mathematics as a Key Technology” at RPTU Kaiserslautern-Landau, with **Mathematics for Technology and Data Science** as my first preference, followed by Actuarial and Financial Mathematics and Mathematics International. I hold a Bachelor of Science in Software Engineering from COMSATS University Islamabad, which I completed in January 2026 with a CGPA of 3.73 out of 4.00 over 134 credit hours, achieving the grade A in every credit-bearing mathematics course on my transcript. I now wish to redirect my academic path from software engineering towards applied and financial mathematics, and RPTU is, in my judgement, the most suitable institution in Europe at which to do so.

My undergraduate training combined a rigorous mathematics sequence — Calculus and Analytic Geometry (A), Linear Algebra (A), Statistics and Probability Theory (A), and Operations Research (B+) — with the algorithmic and modelling disciplines of computer science, including Discrete Structures, Data Structures and Algorithms, Formal Methods, Data Science, and Artificial Intelligence. This dual exposure has convinced me that the most consequential problems in modern finance and risk management — portfolio optimisation under uncertainty, derivative pricing, machine-learning-driven credit scoring, and the regulatory mathematics of Solvency II — sit exactly at the interface of mathematical analysis, stochastic modelling, and computation. I therefore see my software-engineering background not as a diversion from mathematics but as a complementary asset that will allow me to engage directly with the computational and data-driven side of the discipline.

I have chosen RPTU Kaiserslautern-Landau for three concrete reasons. First, the Graduate School’s explicit positioning of mathematics as a “key technology” reflects my own conviction that mathematics acquires its fullest meaning in dialogue with engineering, finance, and the sciences. Second, the curriculum of Mathematics for Technology and Data Science combines the core subjects of applied mathematics — numerical analysis, optimisation, and stochastics — with elective pathways in financial mathematics and data science, allowing me to construct a coherent profile at the intersection of all three programmes to which I am applying. Third, the research environment at the Fraunhofer ITWM, which is closely linked to RPTU, offers an exceptional opportunity to encounter industrial applied mathematics at first hand, an experience that is rarely available at this intensity in South Asian universities.

On completion of the Master programme I intend to work in Germany’s financial and insurance industry, ideally in a quantitative role — as an actuarial analyst, risk modeller, or quantitative developer — where the combination of mathematical depth and software-engineering discipline that I will have acquired at RPTU is in active demand. Germany’s regulatory environment, its strong insurance and reinsurance sector, and the presence of institutions such as Allianz, Munich Re, and the BaFin make it the most attractive destination in Europe in which to begin such a career, and I would welcome the opportunity to contribute professionally to the German economy after graduation.

I would be honoured to bring my academic record, my computational experience, and my motivation to RPTU Kaiserslautern-Landau, and I am fully prepared to relocate to Kaiserslautern and to engage with the programme in English while acquiring working proficiency in German. I thank the Committee for considering my application and remain at its disposal for any further information.

Yours sincerely,

**Muhammad Anwar**
