Faculty of Computer Science and Engineering
Technische Universität Chemnitz
Chemnitz, Saxony, Germany

Subject: Application for admission to the M.Sc. programme Automotive Software Engineering — Summer Semester 2027

Dear Members of the Admissions Committee,

I am writing to apply for admission to the Master's programme in **Automotive Software Engineering** at Technische Universität Chemnitz for the Summer Semester 2027. I hold a Bachelor of Science in Software Engineering from COMSATS University Islamabad, which I completed in January 2026 with a cumulative grade point average of 3.73 out of 4.00 over 134 credit hours, graduating with A grades in the large majority of my software-engineering and systems courses. My objective is to specialise in the development of embedded hardware/software systems for the automotive domain, and TU Chemnitz — with its long-standing reputation in automotive teaching and its location in the heart of the Saxony automotive region — is the ideal place for me to acquire that specialisation.

My undergraduate training maps directly onto the "Automotive Software Engineering" pillar of the Master programme. I completed the full software engineering lifecycle with the grade A in Software Engineering Concepts, Software Design and Architecture, Software Requirement Engineering, and Formal Methods, and the grade B+ in Software Construction and Development, Design Patterns, and Software Re-Engineering, culminating in a two-semester Senior Design Project (I and II) graded A− and A respectively. This coursework gave me hands-on command of requirements analysis, model-driven design, design patterns, and the formal verification of safety-critical properties — the exact skill set that distinguishes automotive software from general-purpose software and that underpins standards such as ISO 26262 and AUTOSAR. I am therefore confident that I enter the programme not as a newcomer to software engineering but as a graduate already fluent in its discipline.

The remaining two pillars of the programme — **Embedded Systems** and **Real-Time and Communication Systems** — are equally well supported by my transcript. I completed Principles of Operating Systems (A), Computer Networks (A−), Data Structures and Algorithms (A), Computer Vision (A−), and Mobile Application Development (B+), building concrete familiarity with concurrency, scheduling, protocol stacks, and the sensor-and-perception pipeline that an advanced driver-assistance system depends on. Coupled with Discrete Structures (A), Applied Physics for Engineers (A), and the mathematics sequence of Calculus, Linear Algebra, and Statistics — all graded A — this background equips me to engage confidently with the embedded, real-time, and signal-processing content of the curriculum from the very first semester.

I have chosen TU Chemnitz for three concrete reasons. First, the Automotive Software Engineering programme is one of very few in Europe that integrates automotive software, embedded systems, and real-time communication as a single coherent curriculum rather than as loosely connected electives. Second, Chemnitz sits at the centre of the Saxon automotive cluster — with Volkswagen, Porsche, and BMW manufacturing plants and a dense ecosystem of Tier-1 suppliers within commuting distance — offering unparalleled opportunities for industrial collaboration, mandatory internships, and the Master's thesis. Third, the Faculty's close cooperation with research institutes such as the Fraunhofer IWU and the automotive research consortium AUTOSAR gives students direct exposure to industry-standard tools and processes that are difficult to access in South Asia.

After completing the Master's programme I intend to work in Germany's automotive industry as an embedded software engineer, ideally in an advanced driver-assistance systems (ADAS) or autonomous-driving team at an OEM such as Volkswagen, BMW, or Audi, or at a Tier-1 supplier such as Bosch, Continental, or ZF. Germany is the global centre of automotive engineering, and the combination of rigorous formal training, mandatory industrial exposure, and proximity to leading manufacturers makes TU Chemnitz the most direct route into this career. I would welcome the opportunity to contribute professionally to the German automotive sector after graduation, and I am fully prepared to relocate to Chemnitz and to acquire working proficiency in German alongside the English-taught curriculum.

I thank the Committee for its time and remain at its disposal for any further information.

Yours sincerely,

Muhammad Anwar
