FRONTEND DEVELOPER TECHNICAL ASSESSMENT

Responsive AI Content GENERATION Web Page

ABOUT FOMI

Fomi is a Product based startup building an AI-powered platform (Fomi) for image and video generation. Users can create, edit, transform, enhance, and upscale images and videos using state-of-the-art AI models through a simple and intuitive interface. Fomi is currently in beta testing, with the goal of becoming one of the leading AI creative platforms globally. The company is based at the National Science & Technology Park (NSTP), Islamabad.

Website: Fomi.art

The platform is designed for creators, designers, marketers, filmmakers, agencies, and social media users who want to turn ideas into professional-quality visual content quickly and easily.

Key features include:

- Text-to-Image Generation
- AI Image/Video Editing
- Text-to-Video Generation
- AI Image/Video Upscaling
- Templates and Presets

Our mission is to become one of the world's leading AI creative platforms, helping users transform imagination into professional-quality images and videos.

OVERVIEW

The goal of this assessment is to evaluate your ability to build a responsive, production-quality frontend using Next.js. A design mockup of an AI content generation web page is given below. Your task is to accurately implement this design as a fully responsive web page.

TECH STACK (REQUIRED)

- Framework: Next.js

• Language: JavaScript

• Styling: CSS Modules, Tailwind CSS

• Version Control: GitHub

Overview

This assessment evaluates far more than your ability to write React code. We're looking for frontend engineers who care deeply about product quality. Great frontend engineering is not just about implementation. It's about creating software that feels fast, intuitive, polished and enjoyable to use. We want to see how you think about:

- user experience
- interaction design
- responsiveness
- performance
- attention to detail
- component architecture
- frontend craftsmanship

Design Philosophy

When building Fomi, we follow a few simple principles.

- **Maximum capability. Minimum complexity.**
- **Every pixel should have a purpose.**
- **Design for professionals, not beginners.**
- **Beautiful software should feel effortless.**
- **The workspace is the hero—not the marketing page.**

The Challenge

This assessment consists of **two independent tasks.**

Part A — Product Implementation

- You will be provided with a mockup design.
- Your task is to implement it as accurately as possible using **Next.js**.
- Deploy final design on Vercel
- We are not simply evaluating whether the page looks correct.
- We are evaluating the overall quality of your frontend engineering.
- You may make minor designs tweaks, to display your creativity.

Requirements

Implement the design with close attention to:

- layout
- spacing
- typography
- hierarchy
- colors
- responsiveness
- animations
- interactions

The final product should feel polished enough for production.

Technical Stack

Required:

- Next.js
- JavaScript
- Tailwind CSS or CSS Modules
- Vercel deployment

Version control: GitHub

Responsiveness

Your implementation should work seamlessly across:

- Mobile
- Tablet
- Desktop
- Large Displays

The experience should feel intentionally designed for each screen size rather than simply scaled.

Avoid:

- horizontal scrolling
- overlapping layouts
- inconsistent spacing
- broken interactions

Dummy Backend

Create a simple mocked API that returns generated images and videos. The objective is not backend complexity. It is demonstrating a realistic frontend architecture.

Feel free to use:

- mock JSON
- local API routes
- static data

Code Quality

We place significant importance on maintainable frontend architecture. Your submission should demonstrate:

- reusable components

- modular design
- clean folder organization
- meaningful naming
- readable code
- scalable architecture

Avoid unnecessary complexity.

Performance

Optimize your implementation wherever appropriate. Examples include:

- next/image
- lazy loading
- code splitting where appropriate
- avoiding unnecessary renders

We care about perceived performance as much as benchmarks.

Accessibility

At minimum, consider:

- semantic HTML
- keyboard navigation
- labels
- alt text
- focus states
- readable contrast

Accessibility should be built in—not added later.

Attention to Detail

This is one of the highest weighted sections. We notice details.

Examples:

- hover behaviour
- loading states
- spacing consistency
- alignment
- animation timing
- button feedback
- empty states
- typography rhythm

Small details create premium software.

PART B — PRODUCT THINKING CHALLENGE (Optional)

Great frontend engineers do more than translate designs into code—they improve products. This challenge is designed to evaluate your product thinking, engineering judgment, attention to detail, and frontend craftsmanship.

Your Challenge

Imagine you have just joined Fomi as a Frontend Engineer. We ask you to redesign one of the most important pages in our product. pick **one**:

1. **Image Generation Workspace**
2. **Video Generation Workspace**
3. **Image Editing Workspace**

Do **not** simply recreate existing products such as Higgsfield, Krea, Leonardo.ai, OpenArt or ImagineArt. Design and build **your own version** of the workspace. Assume AI models continue improving rapidly over the next few years. Rather than designing another AI generator, think about what the **future of AI creative software** should feel like.

Design Assumptions

Assume the user:

- Has already signed in.
- Is returning to continue an existing creative project.
- Creates visual content professionally.
- Spends several hours every day inside the application.

Do not design a marketing landing page. Design the workspace where professional creators actually spend their time.

Design Philosophy

We appreciate interfaces that balance the simplicity of:

- Instagram
- Pinterest with the richness, immersion and capability of products such as:
    - Magnific
    - Higgsfield
    - ImagineArt
    - Leonardo.ai
    - Krea
    - Figma
    - Cursor

These products should be used **only as inspiration**. We are **not** looking for another version of existing AI generators. Original thinking will receive significant weighting.

Product Principles

When making design decisions, remember:

- **Maximum capability. Minimum complexity.**
- **Every pixel should have a purpose.**
- **Design for professionals, not beginners.**
- **The workspace is the hero—not the homepage.**
- **Power should feel effortless.**

What We're Looking For

We're interested in understanding:

- How you organize complex interfaces.
- How you prioritize information.
- How you improve creative workflows.
- How you balance simplicity with powerful functionality.
- How you think about product design—not just visual aesthetics.

A beautiful interface without strong UX or product thinking will not score highly.

Required Deliverables

1. Frontend Implementation

Build a fully responsive frontend implementation of your proposed workspace. We encourage thoughtful interactions, animations, responsiveness, accessibility, and polished details.

Format: A pdf with Vercel link for submission of assesment task.

---

2. Product Thinking Document

Along with your submission, include a short document answering the following questions.

1. What problem were you trying to solve?

What type of user did you design for?

---

2. What are the three most important UX decisions you made?

Why?

---

3. Which features did you intentionally leave out?

Why did you decide not to include them?

---

4. Which existing products inspired your thinking?

What did you like?

What would you improve?

---

5. If you had another month to work on this product, what would you improve?

---

6. What is the single feature or workflow you believe differentiates your workspace from existing AI creative platforms?

Design Trade-offs

Every great product involves compromise. We are interested in understanding:

- what you prioritized,
- what you simplified,
- what you removed,
- and why.

There is no perfect interface. Strong product engineers know what **not** to build.

Engineering Expectations

Your submission should demonstrate:

- Clean architecture
- Reusable components
- Maintainable code
- Responsive layouts
- Accessibility
- Smooth interactions
- Thoughtful animations
- Excellent attention to detail
- Good frontend performance

Evaluation Criteria

Category	Points
Product Thinking	20
Frontend Engineering	20
Code Quality & Architecture	15
UX & Interaction	15
Visual Polish & Attention to Detail	10
Originality	10

Product Thinking Document	10

Bonus (+40)

Interactive (+10)

Beautiful micro-interactions.

Meaningful transitions.

Exceptional Product Thinking (+15)

A creative workspace that demonstrates strong UX thinking.

Original Creative Direction (+15)

A unique vision of what AI creative software could become.

Common Mistakes

Avoid:

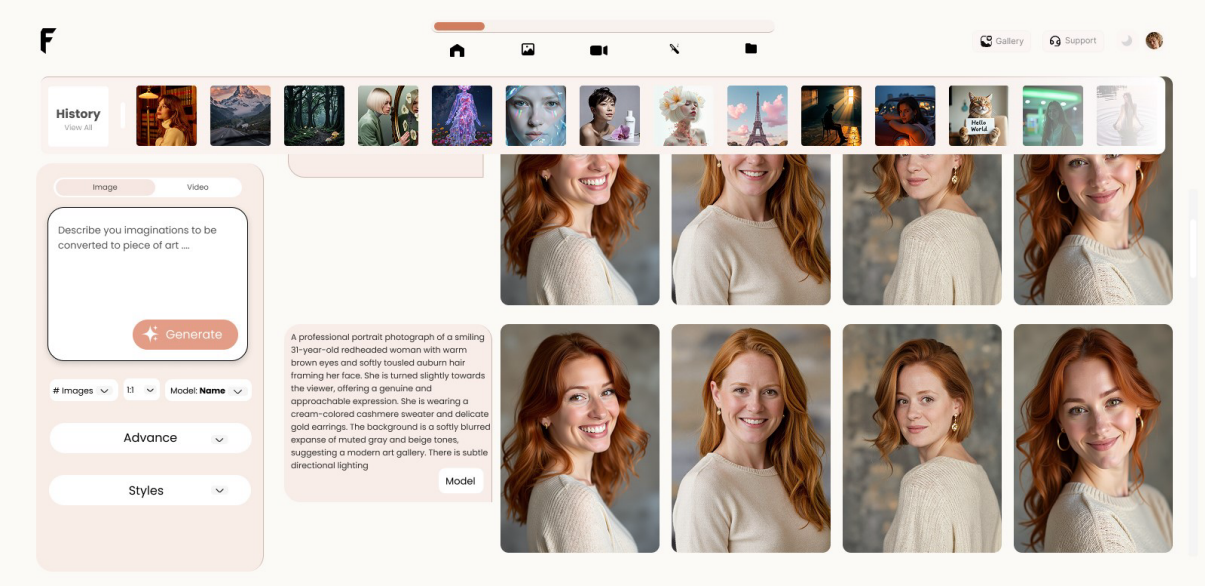

- Copying existing AI generators.
- Generic AI-generated layouts.
- Adding unnecessary features.
- Cluttered interfaces.
- Empty minimalism.
- Weak hierarchy.
- Poor spacing.
- Prioritizing aesthetics over usability.

Important

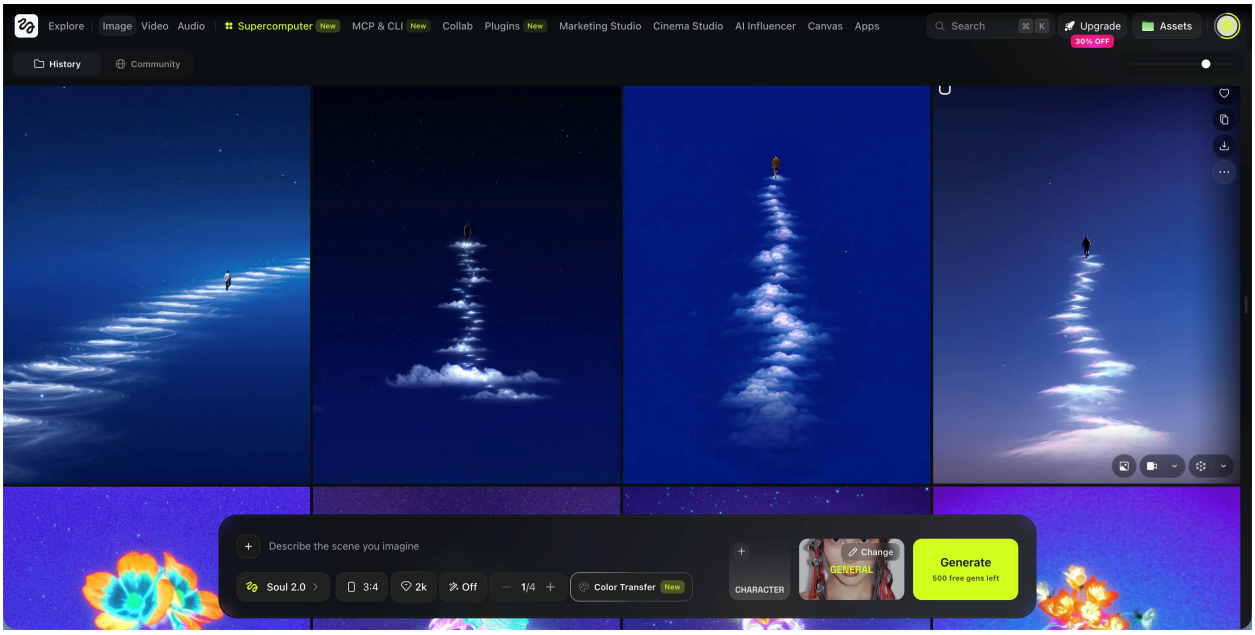

You are welcome to use AI tools during this assessment. However, AI is only one tool. During the interview, we will discuss your submission in detail and ask you to explain your product decisions, engineering choices, and design rationale. We are evaluating your thinking—not whether AI helped you write code or generate ideas.

Final Advice

Imagine this is the software you would personally use every day if creating AI images and videos professionally. Build something that feels:

- Original
- Thoughtful
- Fast
- Beautiful
- Professional
- Immersive

Most importantly, build something that solves real user problems—not just something that looks futuristic.
